

## XC/RQS XactMan® Requisition System

XC/RQS is designed to provide business environments with an automated method of tracking purchase requisitions, providing multi level approval, electronic notification of 'action required', and ultimately automatic creation of purchase orders in the MANMAN® Purchasing system. Business rules are taken into consideration with a fully configurable group of optional settings.

XC/RQS interfaces with the Quantum Software Security System where a user is defined as a requisitioner, approver or purchaser. Each of these types of users has different capabilities. When a new requisition is added, an email is sent

notifying the designated approver. The approver can approve individual lines of the requisition and change the quantities and pricing if desired. Once a requisition is approved, it is available to the purchaser and can then be converted into a standard MANMAN® purchase order. Approved lines from various requisitions can be consolidated into one purchase order. The purchaser can also add parts from the MRP Planned Orders data to the same purchase order.

In addition to notifications via email, XC/RQS also has a sophisticated messaging system that allows users to add notes to requisitions that can be viewed by a particular individual, or system wide.

Maintaining Requisitions

Converting Requisitions to a Purchase Order

Requirements: Windows 95/98/NT/2000, Internet Explorer 4.0 or higher, TCP/IP network access to HP/3000
